## A Survey of Quantum Computing for Finance

[Dylan Herman](#), [Cody Googin](#), [Xiaoyuan Liu](#), [Alexey Galda](#), [Ilya Safro](#), [Yue Sun](#), [Marco Pistoia](#), [Yuri Alexeev](#)

Quantum computers are expected to surpass the computational capabilities of classical computers during this decade and have transformative impact on numerous industry sectors, particularly finance. In fact, finance is estimated to be the first industry sector to benefit from quantum computing, not only in the medium and long terms, but even in the short term. This survey paper presents a comprehensive summary of the state of the art of quantum computing for financial applications, with particular emphasis on stochastic modeling, optimization, and machine learning, describing how these solutions, adapted to work on a quantum computer, can potentially help to solve financial problems, such as derivative pricing, risk modeling, portfolio optimization, natural language processing, and fraud detection, more efficiently and accurately. We also discuss the feasibility of these algorithms on near-term quantum computers with various hardware implementations and demonstrate how they relate to a wide range of use cases in finance. We hope this article will not only serve as a reference for academic researchers and industry practitioners but also inspire new ideas for future research.

### 2022 Roadmap on Neuromorphic Computing and Engineering

Dennis V. Christensen, Regina Dittmann, Bernabé Linares-Barranco, Abu Sebastian, Manuel Le Gallo, Andrea Redaelli, Stefan Slesazcek, Thomas Mikolajick, Sabina Spiga, Stephan Menzel, Ilija Valov, Gianluca Milano, Carlo Ricciardi, Shi-Jun Liang, Feng Miao, Mario Lanza, Tyler J. Quill, Scott T. Keene, Alberto Salleo, Julie Grollier, Danijela Marković, Alice Mizrahi, Peng Yao, J. Joshua Yang, Giacomo Indiveri, John Paul Strachan, Suman Datta, Elisa Vianello, Alexandre Valentian, Johannes Feldmann, Xuan Li, Wolfram H.P. Pernice, Harish Bhaskaran, Steve Furber, Emre Neftci, Franz Scherr, Wolfgang Maass, Srikanth Ramaswamy, Jonathan Tapson, Priyadarshini Panda, Youngeun Kim, Gouhei Tanaka, Simon Thorpe, Chiara Bartolozzi, Thomas A. Cleland, Christoph Posch, Shih-Chii Liu, Gabriella Panuccio, Mufti Mahmud, Arnab Neelam Mazumder, Morteza Hosseini, Thanoosh Mohsenin, Elisa Donati, Silvia Tolu, Roberto Galeazzi, Martin Ejsing Christensen, Sune Holm, Daniele Ielmini, N. Prysds

Modern computation based on the von Neumann architecture is today a mature cutting-edge science. In the Von Neumann architecture, processing and memory units are implemented as separate blocks interchanging data intensively and continuously. This data transfer is responsible for a large part of the power consumption. The next generation computer technology is expected to solve problems at the exascale with 1018 calculations each second. Even though these future computers will be incredibly powerful, if they are based on von Neumann type architectures, they will consume between 20 and 30 megawatts of power and will not have intrinsic physically built-in capabilities to learn or deal with complex data as our brain does. These needs can be addressed by neuromorphic computing systems which are inspired by the biological concepts of the human brain. This new generation of computers has the potential to be used for the storage and processing of large amounts of digital information with much lower power consumption than conventional processors. Among their potential future applications, an important niche is moving the control from data centers to edge devices.

The aim of this Roadmap is to present a snapshot of the present state of neuromorphic technology and provide an opinion on the challenges and opportunities that the future holds in the major areas of neuromorphic technology, namely materials, devices, neuromorphic circuits, neuromorphic algorithms, applications, and ethics. The Roadmap is a collection of perspectives where leading researchers in the neuromorphic community provide their own view about the current state and the future challenges. We hope that this Roadmap will be a useful resource to readers outside this field. For those who

(for scientists and engineers)

Science + Humanities

STEAM is important

Sample from Week 2 (Can AI Be Intelligent?)

- Aristotle, *Nicomachean Ethics*, Book I.1–5
- Turing, “Computing Machinery and Intelligence”
- What is Aristotle’s argument about happiness, and how would you judge the objectives of AI on that basis?

Sample from Week 12 (Unartificial Intelligence)

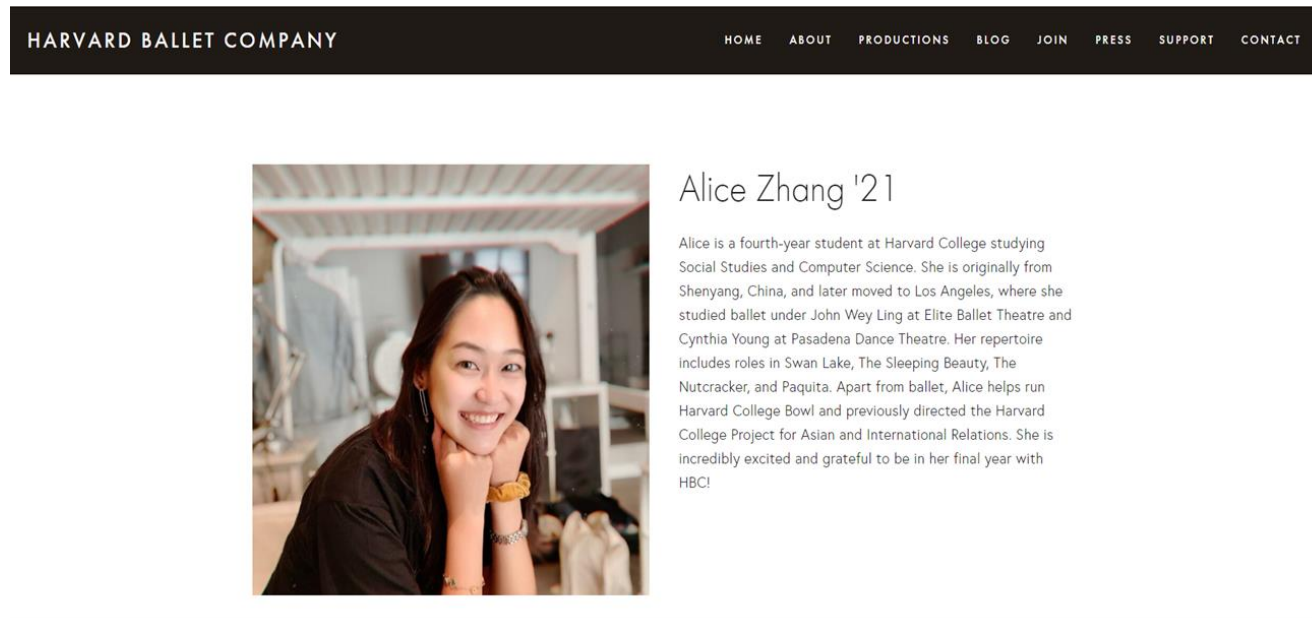

- Plato, *The Republic*, Book VII, “Simile of the Cave”
- Aristotle, *Nicomachean Ethics*, Book IX, X.6-8
- Leonardo, images, notebooks
- Michelangelo, Sistine Chapel
- According to Plato, what is the relation of thinking and genuine education to freedom?
- What is great about Leonardo and Michelangelo, and can AI mimic them? Why or why not?
- How does AI contribute toward or hinder these endeavors?

The screenshot shows the MIT OpenCourseWare website for the course "ETHICS FOR ENGINEERS: ARTIFICIAL INTELLIGENCE". The page features a navigation menu on the left with links for SYLLABUS, CALENDAR, READINGS AND VIEWINGS, and ASSIGNMENTS. The main content area includes a course description, course info, and a list of departments. The course description states: "Artificial Intelligence (AI), and the algorithmic judgment at its core, is developing at breakneck speed. This version of the popular Ethics for Engineers course focuses on the ethics issues involved in the latest developments of computer science." The course info section lists the instructors as Prof. Bernhardt Trout and Daniel Doneson, and the course number as 10.01, 1.082, 2.900, and 22.014. The departments listed are Chemical Engineering and Mechanical Engineering. The page also features a "GIVE NOW" button and links for "ABOUT OCW", "HELP & FAQs", and "CONTACT US".

# Important: teamwork/collaboration, interdisciplinarity, building confidence, critical thinking, questioning, speaking/writing

## A (Harvard) example:

- Choice of concentration (50 fields)
- Joint/Double concentrations (see left panel)
- Collab pedagogies and platforms/tools:
  - ✓ In-person or online [Zoom (breakout rooms)]
  - ✓ Collab activities in class
  - ✓ Platforms for “social” learning, team-formation
  - ✓ Individual + Team Evaluation
  - ✓ Projects (not exams, collaborate but “own” the solution)
  - ✓ Easy-to-learn/powerful comp. languages [python]
  - ✓ Jupyter Notebook, Google Colab
  - ✓ Innovative grading schemes, auto-grader (s/w)
  - ✓ Help-rooms, office-hours, sections

The screenshot shows the Harvard Ballet Company website. The navigation bar includes links for HOME, ABOUT, PRODUCTIONS, BLOG, JOIN, PRESS, SUPPORT, and CONTACT. The main content area features a profile for Alice Zhang '21, a fourth-year student at Harvard College. To the left of the text is a photograph of Alice Zhang, a young woman with dark hair, smiling and resting her chin on her hands. The text describes her background, her studies in Social Studies and Computer Science, her ballet training, and her involvement in various student organizations and projects.

HARVARD BALLET COMPANY

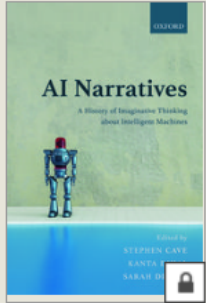

HOME ABOUT PRODUCTIONS BLOG JOIN PRESS SUPPORT CONTACT

Alice Zhang '21

Alice is a fourth-year student at Harvard College studying Social Studies and Computer Science. She is originally from Shenyang, China, and later moved to Los Angeles, where she studied ballet under John Wey Ling at Elite Ballet Theatre and Cynthia Young at Pasadena Dance Theatre. Her repertoire includes roles in Swan Lake, The Sleeping Beauty, The Nutcracker, and Paquita. Apart from ballet, Alice helps run Harvard College Bowl and previously directed the Harvard College Project for Asian and International Relations. She is incredibly excited and grateful to be in her final year with HBC!
